

Here is full instructions.

Here's troubleshooting procedure:

**The power switch is lit-up but the unit does not work:**

Verify the unit is properly closed and all 8 screws are in place. The safety switch must be closed by the enclosure in order for the lamp to have power. (safety feature shuts off bulb if enclosure isn't properly closed)

**The power switch is lit-up and the fan is running, but the bulb will not fire:**

If the fan is running but the light is not it could be a couple of things. First bulb will not fire. disconnect power then open the unit and verify the lamp is properly connected to the 4-pin socket assembly. Close the unit and try it again, if it still doesn't light, the UV lamp is probably no good.
